Summary

Type	DeFi	Total Issues	0 (0 resolved)
Timeline	From 2025-12-22 To 2026-01-14	Critical Severity Issues	0 (0 resolved)
Languages	Solidity	High Severity Issues	0 (0 resolved)
		Medium Severity Issues	0 (0 resolved)
		Low Severity Issues	0 (0 resolved)
		Notes & Additional Information	0 (0 resolved)
		Client Reported Issues	0 (0 resolved)

Scope

OpenZeppelin performed an audit of the [Uniswap/blocknumberish](#) repository at the [b911c96 commit](#).

In scope were the following files:

```
contracts
├── src
│   └── BlockNumberish.sol
```

System Overview

The `BlockNumberish` helper contract allows other contracts to interface smoothly with the Arbitrum One and Unichain Layer 2 blockchains.

On Arbitrum, the built-in `block.number` returns the L1 block number rather than the L2 block number. However, contracts often expect `block.number` to correspond to the block number of the chain the contract is deployed on, which makes certain contracts incompatible with Arbitrum. The `_getBlockNumberish` function returns the Arbitrum L2 block number on Arbitrum, and the standard `block.number` elsewhere.

The `_getFlashblockNumberish` function returns the flashblock number on Unichain. If this function is used outside of Unichain, a null value is returned.

Security Model and Privileged Roles

The `_getBlockNumberish` function returns the L2 block number for the Arbitrum chain but does not automatically return the L2 block number for other chains with similar behavior.

The contracts introduce no additional privileged roles.

Conclusion

The Blocknumberish contract facilitates the retrieval of the native block number on Arbitrum One and flashblock number on Unichain. No issues were found in this contract, which is a testament to the quality of the codebase. The Uniswap Labs team is appreciated for providing a detailed walkthrough of the codebase and promptly answering any questions the audit team had about the codebase.
